

TRIASSIC - ABOUT 210 MILLION YEARS AGO

(Fundy Gp., Argo & Eurydice Fms.)

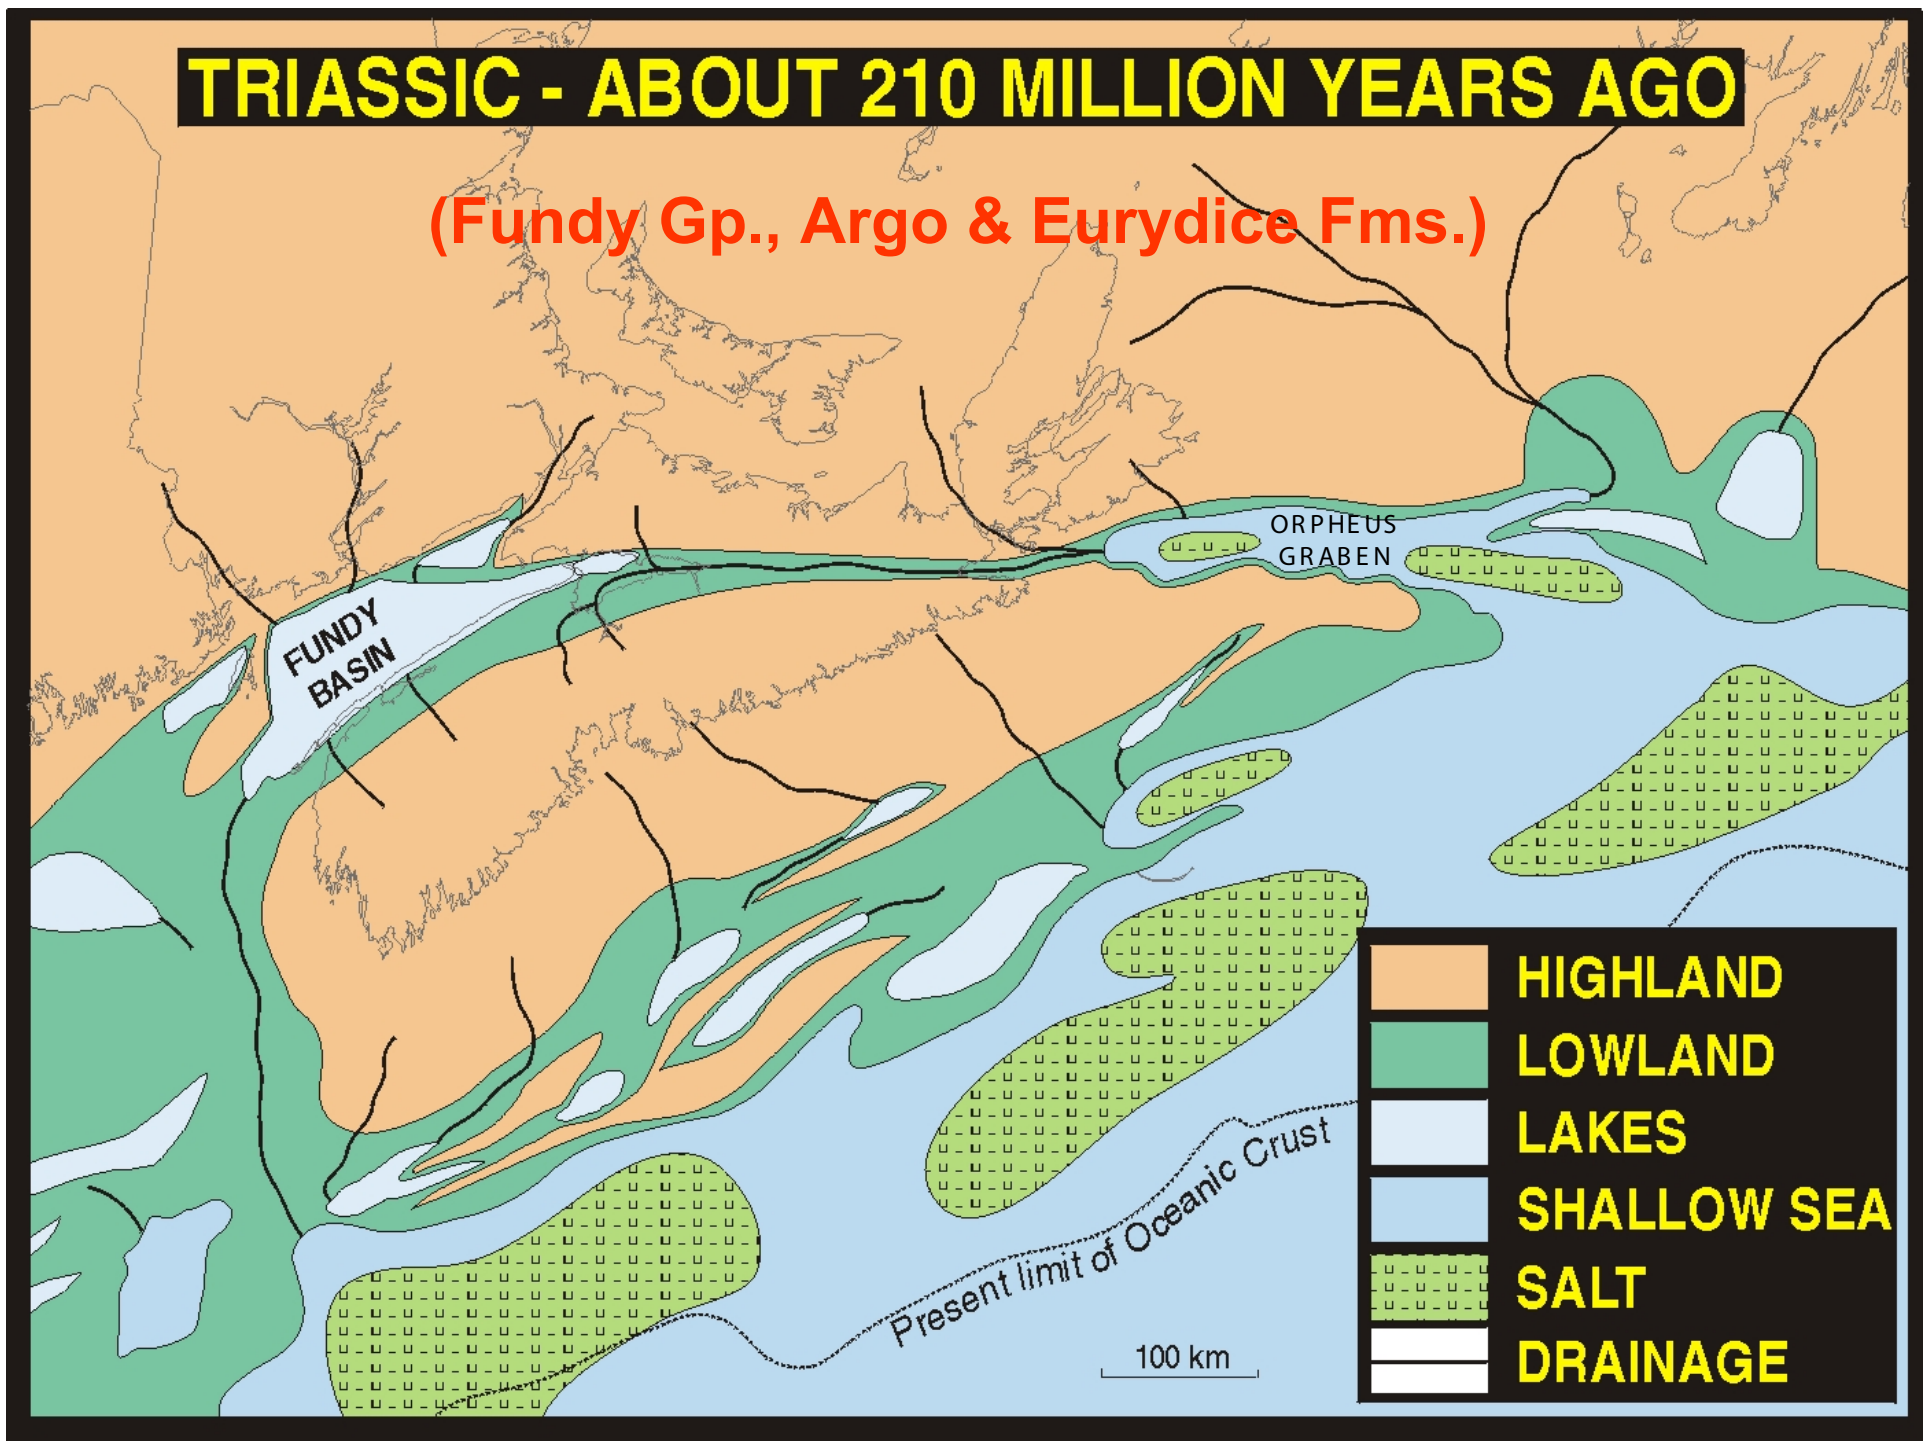

Figure 5: Simplified paleogeographic reconstruction of the Scotian Basin during the Late Triassic (Rhaetian) ca. 210 mya. Salt deposition likely was initiated during this period although on a much smaller scale than illustrated here. Argo formation salts of this age have yet to be sampled in this basin but are present on the southeast Grand Banks. Copyright © Atlantic Geoscience Society – used with permission.
