

Figure 11 – Close-up of the top autochthonous salt to primary weld marker, showing the synrift 'fabric' produced by underlying rift blocks, with offsets on minibasins interpreted to be caused by a transfer fault. The figure also illustrates the transition from the SD province to the ASM province where allochthonous salt bodies were expelled from a chain of minibasins along the base of the image. Shallow areas are red, deep areas are purple. See Figure 1a for location.
