

Figure 6 - Interpreted Seismic line drawing showing correlation of mapped seismic horizons from the shelf to deep water, faulting related to basin subsidence and salt withdrawal and salt (black polygons). Well penetrations are also shown, some wells have been projected onto this line from distances of up to 15 km away in the strike direction. The interpretation of basement is somewhat schematic as the seismic imaging does not produce a strong reflection at these burial depths. Seismic horizons T51-J158 are labeled, along with the locations of canyons A-E. See Figures 2 and 7-11 for line locations and intersecting points of interest.
